

CONSTRUCTION SPECIFICATIONS

SPECIAL CONDITIONS

1. A minimum cover of three (3) feet over the proposed lines is required.
2. No work shall begin without notifying Franklin County 24 hours in advance. The contractor is responsible for obtaining any and all necessary permits.
3. No work shall begin without written approval of construction plans.
4. Work shall be subject to inspection by the County Inspectors and design engineer.
5. Contractor shall be responsible for locating and uncovering all valve boxes after surface treatment of roads and adjusting boxes to final road grades, if necessary.
6. All existing utilities may be shown or may not be shown in the exact location. The contractor shall comply with the State Water Works regulations, section 12.05.03 where lines cross.
7. The contractor shall notify the County of any field corrections to the approved plans prior to such construction. Contractor shall maintain a set of red-lined plans showing location of all installations. As-built information shall be submitted to the design engineer for proper action of as-built plans.
8. All trenches within the existing or future Virginia State Department of Highways and Transportation right-of-way must be compacted in six inch layers.
9. All lines to be staked prior to construction.
10. Contractor to coordinate with the Engineer to provide as-built plans.
11. All construction shall be in accordance to approved construction practices of the applicable trades.
12. Unless noted otherwise herein all construction shall be in accordance to the latest edition of AWWA standards.

EXCAVATION, STABILIZATION AND BEDDING

- A. TRENCHING
 1. Excavation for trenches shall include the removal of all material encountered regardless of classification in accordance with the elevations and grades at the locations and stations indicated on the plans specified herein.
 2. Excavation, unless otherwise specified, shall be open cut. The Contractor shall open no more than two hundred (200) feet of trench at one time during the laying of pipe, unless approved by the Engineer.
 3. Trenches shall be excavated in straight lines and shall be accurately graded in order to establish a true elevation for the invert of the pipe.
 4. The width of trenches, from existing grade to one (1) foot above the top of the pipe shall be of sufficient width to permit the proper installation of bracing, shoring or sheeting.
 5. The sides of the trenches shall be as vertical as practical.
 6. Excavation for structures shall allow a minimum of twelve (12) inches clear between the structure and the sides of the trench, any required bracing, shoring or sheeting.
 7. Excavated materials suitable for backfill shall be stockpiled in an orderly manner at a sufficient distance from the sides of the trench in order to avoid overloading the banks of the trench and to prevent slides or cave-ins.
 8. Excavated materials which are not required or approved for backfill shall be removed from the site and disposed of by the Contractor, at his expense.
 9. Contractor shall adhere to all local, state and federal construction laws, including D.S.H.A. trench safety regulations.

B. TRENCH STABILIZATION

1. Trench stabilization material shall be coarse aggregate size Number 2 and shall conform with VDOT Section 203 and/or ASTM C 33.
 2. Whenever excessively wet or unstable material is encountered in the bottom of the trench, which in the opinion of the Engineer is incapable of properly supporting the pipe or structures, such material shall be removed and backfilled with trench stabilization material and shall be graded to allow for the compacted bedding material.
3. All unauthorized overdepths of excavation shall be backfilled with trench stabilization material and shall be graded to allow for the compacted bedding material.

C. COMPACTED BEDDING MATERIAL

1. Bedding material shall be coarse aggregate size Number 57 and shall conform with VDOT Section 203 and/or ASTM C 33.
2. The bottom of the pipe trench shall be excavated to a minimum overdepth of Six (6) inches below the bottom of the pipe, to provide for the compacted bedding material. Bedding material shall be placed, shaped and compacted.
3. Bell holes and depressions required for the jointing of the pipe shall be dug after the compacted bedding material has been graded and shaped and shall be only of the length, depth and width required to make the joint properly.

PIPE, JOINTS AND FITTINGS

- A. SCOPE OF WORK
 1. All materials and appurtenances required for the work shall be new, of first class quality and shall be furnished, delivered, erected, connected and finished in accordance with specifications. All materials found defective in any respect or having any weakness shall be replaced with new material at the expense of the Contractor.
 2. The materials specified for the construction shall comply with the latest revisions of the applicable American Society for Testing Materials (ASTM), American National Standards Institute (ANSI) and/or the Virginia Department of Transportation (VDOT) standards.

B. OPTIONAL PIPE SELECTIONS

1. The Contractor shall install only one (1) type of pipe

- between structures except where ductile iron pipe is specified or indicated. Where existing pipe is to be replaced or extended the same type of pipe shall be installed, unless specified or indicated otherwise.
2. Water lines shall be PVC.
3. Water service laterals shall be either copper or polyvinyl chloride pipe, at the Contractor's option, unless specified or indicated otherwise.

C. TYPES OF PIPE

1. Polyvinyl chloride (PVC) water pipe shall conform to AWWA C414-81 20 psi (SDR-21) PIPE. All PVC pipe must bear the National Sanitation Foundation Potable Water (NSF/PW) stamp. Only bell and spigot with elastomeric gasket joints shall be used. To facilitate future locating of PVC water pipe, a metallic wire or locator tape shall be laid with the pipe and in contact with all fittings and valves.

D. JOINTS, COUPLINGS, AND APPURTENANCES

1. PVC pipe and fittings shall be bell and spigot type joints. The bell and spigot joint shall be sealed with elastomeric gaskets conforming to ASTM D 3212. The joints shall be made in strict accordance with the recommendation of the pipe manufacturer.
2. All PVC pipe fittings must meet pipe specifications for SDR-21 pipe and be of the same manufacturer as the pipe. All in accordance with AWWA specification C-110 and ANSI standard A21.10.
3. Gate Valves shall be iron-body, bronze-mounted, double-disc, parallel-seal, D-ring sealed, inside-screw, non-rising stem, fitting with 2 inch square operating nut for future vault service. All in accordance with AWWA standard C501 (latest revision). The valve shall be suitable for the pipe with which it is used. The valves shall be suitable for 200 p.s.i. water working pressure and shall be tested at twice the rated working pressure. All gate valves shall be installed in the valve vaults and equipped with a handle opening and closing the nut shall be marked with an arrow and the word "OPEN" and shall open by turning to the right (clockwise).

4. Valve vaults shall be precast concrete with cast iron frame and covers. The cover shall be marked as shown on the details, sizes and dimensions shall meet those shown on plans and details.

5. All valve boxes, base extensions, head and cover shall be of cast or ductile iron. Valve boxes shall be of the "Type I" design as defined in the "Standard for Valve Boxes" (ASME A112.19.2-1982). The shaft diameter shall not be less than five inches (5"). The valve boxes shall have a minimum range of extension to fit two inch (2") to twelve inch (12") valves inclusive, placed or mains at depths of three feet, (3') to twelve feet (12') below the ground surface, whenever the valve box is set to finished grade. Valve boxes shall be Mueller Company 10364, or approved equal. Valve boxes shall be centered over the valve screw and set plumb.

6. The water meter box and accessories therein necessary for meter installation shall be furnished and installed by the Contractor just within the right-of-way/easement at the property line as shown on the approved subdivision or other property plan. The meter box and its setting shall be furnished and installed as shown on the Project Details. All meter setters shall be equipped with integral lockable valves on both sides of the meter connections. All valves, setters and boxes shall be set plumb and compacted to ensure a stable setting.

7. All water meters shall be installed by the Contractor as directed by the Owner. Meters shall be 5/8" x 3/4" disc meter as made by Badger Meter Co. or equal.

8. All other materials and appurtenances to be in accordance with details shown on plans.

PIPE INSTALLATION

A. GENERAL

1. The Contractor shall not lay pipe or place manholes until all water has been removed from the trench, or when in the opinion of the Engineer, the trench or the weather conditions are unsuitable for work.
2. Pipe that may require field cutting shall be done so in a neat and workmanlike manner, so as to leave a smooth end at right angles to the axis of the pipe. Care shall be taken to avoid damaging the pipe and any coatings or linings. Ductile iron pipe shall not be cut with an acetylene torch.
3. The materials shall be visually inspected for defects before lowering the pipe or placing the manholes into the trench. Any foreign material shall be removed and cleaned from the pipe or manhole. The interior of the pipe shall be clear of all soil, debris and superfluous materials prior to and during the installation.
4. The Contractor shall exercise every precaution to prevent foreign material from entering the pipe while it is being placed in the trench. Failure by the contractor to take such precautions may result in the Engineer requiring a heavy, tightly woven canvas bag of suitable size be placed over each end of the pipe and removed only when the joint can be made properly.
5. The pipe and manholes shall be lowered carefully into the trench by suitable means and handled with care at all times to avoid damage. Under no circumstance shall the materials be dropped or dumped into the trench.
6. When work is not in progress, the Contractor shall plug the open ends of the pipe to prevent trench water or other substances from entering the pipe. The plug shall be watertight and shall remain in place until any required dewatering has been completed.
7. Water pipe shall not be laid closer horizontally than ten (10) feet from a sewer line except where the bottom of the water pipe is at least 18 inches above the top of the sewer line and will be in a separate trench. Water pipe shall not be allowed to pass through a sewer manhole.
8. Before joints are made the pipe shall be well bedded on a firm foundation and no pipe shall be brought into position until the preceding length has been thoroughly embedded and secured in place. Any defects due to settlement shall be made good by the Contractor at his expense. Bell holes shall be dug sufficiently large to insure the making of proper joints.
9. Pipe shall be jointed in full accordance with

manufacturer's recommendations. Push-on joints shall be thoroughly cleaned, the rubber gasket inserted in the bell socket, the tail of the applied gasket that can't be pulled into the joint and the pipe inserted into the socket and the joint completed by forcing the spigot end to the bottom of the socket by a jack-type tool or other device approved by the Engineer. Mechanical joints shall be thoroughly cleaned, the gland slipped over the spigot and the gland moved into position, the solution injected and placed on the spigot end, the spigot end of the pipe seated in the bell, the gland moved into position, and bolts and nuts assembled by hand and tightened with an torque-limiting wrench.

B. INSTALLING WATER MAINS

1. The water main shall be laid and maintained at the required lines and grads with fittings and valves at the required locations.
2. Deflection of the line of pipe, in either, the vertical or horizontal plane to avoid obstructions, or in locations where long radius curves are required, the degree of deflection shall not exceed six (6) degrees in accordance with AWWA standard A21.10. Angles that may require deflections in excess of the recommended limitations, special bends, or a sufficient number of shorter lengths of pipe to provide the angular deflections within the limits as set forth, shall be approved by the Engineer.

3. All plugs, except mechanical joint plugs at connections for future lines, all tees, and all bends in water mains under pressure shall be provided with reaction backing consisting of concrete thrust blocks. Valves for connections to future lines and hydrants shall be anchored to the water main with the rods.

C. DISINFECTION OF WATER MAINS

1. All pipe shall be disinfected, tested and flushed in accordance with AWWA Standard C601 (latest revision).
2. Contractor shall provide all materials, equipment, necessary tools and perform all work required for the sterilization, testing and flushing of the water main.
3. No tested section of water line shall be approved to deliver water service until a favorable laboratory report has been achieved. Any tested section of water line failing to meet the requirements specified shall be repaired by the Contractor and retested until the results are within the limits specified.

D. BACKFILL BELOW EXISTING OR NEW PAVED AREAS AND SIDEWALKS

1. Backfill from the top of the pipe bedding or bottom of the pipe trench to one (1) foot above the top of the pipe shall be free of stones larger than two (2) inches in diameter and shall be placed in layers not to exceed six (6) inches and compacted with hand operated tampers.

2. Backfill from one (1) foot above the top of the pipe to the topsoil subgrade shall be free to stones larger than six (6) inches in diameter and shall be placed in layers not to exceed twelve (12) inches and compacted with mechanical tampers.

E. INSPECTION AND TESTS

A. TESTING OF WATER LINES

1. After placing all hardware and all valve support, sufficient backfill shall be placed prior to filling the pipe with water and field testing to prevent lifting of the pipe. Where local conditions require that the trenches be backfilled immediately after the pipe has been laid, the testing shall be carried out after the backfilling has been completed but prior to placement of the permanent surface. At least fourteen (14) days shall elapse after the last valve support or hydrant block has been cast (Type I Portland Cement) prior to testing, unless high early strength concrete (Type III) is used, in which case three (3) days shall elapse.
2. All testing will be performed in accordance with the AWWA C600-82 or current revision.
3. Pressure Test: After the pipe has been laid, all newly laid pipe on any valved section thereof shall be subjected to a hydrostatic pressure of at least 1.5 times the working pressure at the point of testing.

Test pressure restrictions. Test pressures shall:

- a. not be less than 1.50 times the working pressure at the highest point along the test section
- b. not exceed pipe or thrust restraint design pressures
- c. be of at least 2-hour duration
- d. not vary by more than $\pm 5\text{ psi}$
- e. not exceed twice the rated pressure of the valves or hydrants when the pressure boundary of the test section includes closed gate valves or hydrants
- f. not exceed the rated pressure of the valve

Each valved section of pipe shall be filled with properly disinfected water slowly and the specified test pressure shall be applied by means of a pump connected to the pipe in a manner satisfactory to the Engineer.

Before applying the specified test pressure, air shall be expelled completely from the pipe, valves, and hydrants.

All exposed pipe, fittings, valves, hydrants and joints shall be examined visually during the test. Any damaged exposed pipe, fittings, valves or joints that are discovered following the pressure test shall be repaired until it is satisfactory to the Engineer.

A leakage test shall be conducted concurrently with the pressure test. Leakage shall be defined as the quantity of water that must be supplied into the newly laid pipe, or any valved section thereof, to maintain pressure within 5 psi of the specified test pressure after the air in the pipeline has been expelled and the pipe has been filled with water. No pipe installation will be accepted if the leakage is greater than that determined by the following formula:

$$L = \frac{S \cdot D \cdot V(P)}{133,200}$$

In which L is the allowable leakage, in gallons per hour; S is the length of pipeline tested in feet; D is the nominal diameter of the pipe, in inches; and P is the pressure tested, in pounds per square inch gauge. When testing against closed metal-seated valves, an additional leakage of enclosed valve of 0.0078 gal/hr/in² of nominal valve size shall be allowed. When hydrants are in the test section, the test shall be made on the basis of available leakage. If any test of pipe laid in a location leakage greater than the allowable amount, the Contractor shall, at his own expense, locate and repair the defective material until the leakage is within the specified allowance. All visible leaks are to be repaired regardless of the amount of leakage.

4. A leakage test shall be conducted concurrently with the pressure test. Leakage shall be defined as the quantity of water that must be supplied into the newly laid pipe, or any valved section thereof, to maintain pressure within 5 psi of the specified test pressure after the air in the pipeline has been expelled and the pipe has been filled with water. No pipe installation will be accepted if the leakage is greater than that determined by the following formula:

$$L = \frac{S \cdot D \cdot V(P)}{133,200}$$

In which L is the allowable leakage, in gallons per hour; S is the length of pipeline tested in feet; D is the nominal diameter of the pipe, in inches; and P is the pressure tested, in pounds per square inch gauge. When testing against closed metal-seated valves, an additional leakage of enclosed valve of 0.0078 gal/hr/in² of nominal valve size shall be allowed. When hydrants are in the test section, the test shall be made on the basis of available leakage. If any test of pipe laid in a location leakage greater than the allowable amount, the Contractor shall, at his own expense, locate and repair the defective material until the leakage is within the specified allowance. All visible leaks are to be repaired regardless of the amount of leakage.

5. Backfill shall not be placed or compacted against cast in place concrete until it has obtained sufficient strength to withstand the backfilled pressure placed upon it.

6. Upon the completion of backfilling, all excess soil, stones and debris shall be removed from the site and disposed of by the Contractor.

B. BACKFILL MATERIAL

1. Materials for backfill shall be approved excavated material or approved suitable material obtained from other sources. All material shall be approved by Soil Engineer.
