

WATER SPECIFICATIONS

SPECIAL CONDITIONS

1. A minimum cover of three (3) feet over the proposed lines is required.
2. No work shall begin without notifying Franklin County 24 hours in advance. The contractor is responsible for obtaining any and all necessary permits.
3. No work shall begin without written approval of construction plans.
4. Work shall be subject to inspection by the County Inspectors and design engineer.
5. Contractor shall be responsible for locating and uncovering all valve boxes after surface treatment of roads and adjusting boxes to final road grades, if necessary.
6. All existing utilities may be shown or may not be shown in the exact location. The contractor shall comply with the State Water Works regulations, section 12.05.03 where lines cross.
7. The contractor shall notify the County of any field corrections to the approved plans prior to such construction. Contractor shall maintain a set of red-lined plans showing location of all installations. As-built information shall be submitted to the design engineer for proper action of as-built plans.
8. All trenches within the existing or future Virginia State Department of Highways and Transportation right-of-way must be compacted in six inch layers.
9. All lines to be staked prior to construction.
10. Contractor to coordinate with the Engineer to provide as-built plans.
11. All construction shall be in accordance to approved construction practices of the applicable trades.
12. Unless noted otherwise herein all construction shall be in accordance to the latest edition of AWWA standards.

EXCAVATION, STABILIZATION AND BEDDING

- A. TRENCHING
1. Excavation for trenches shall include the removal of all material encountered regardless of classification in accordance with the elevations and grades at the locations and stations indicated on the plans or specified herein.
 2. Excavation, unless otherwise specified, shall be open cut. The Contractor shall open no more than two hundred (200) feet of trench at one time during the laying of pipe, unless approved by the Engineer.
 3. Trenches shall be excavated in straight lines and shall be accurately graded in order to establish a true elevation for the invert of the pipe.
 4. The width of trenches, from existing grade to one (1) foot above the top of the pipe shall be of sufficient width to permit the proper installation of bracing, shoring or sheeting.
 5. The sides of the trenches shall be as vertical as practical.
 6. Excavation for structures shall allow a minimum of twelve (12) inches clear between the structure and the sides of the trench or any required bracing, shoring or sheeting.
 7. Excavated materials suitable for backfill shall be stockpiled in an orderly manner at a sufficient distance from the sides of the trench in order to avoid oversteepening the banks of the trench and to prevent slides or cave-ins.
 8. Excavated materials which are not required or approved for backfill shall be removed from the site and disposed of by the Contractor, at his expense.
 9. Contractor shall adhere to all local, state and federal construction laws, including D.S.H.A. trench safety regulations.
- B. TRENCH STABILIZATION
1. Trench stabilization material shall be coarse aggregate size Number 2 and shall conform with VDOT Section 203 and/or ASTM C 33.
 2. Whenever excessively wet or unstable material is encountered in the bottom of the trench, which in the opinion of the Engineer is incapable of properly supporting the pipe or structures, such material shall be removed and backfilled with trench stabilization material and shall be graded to allow for the compacted bedding material.
 3. All unauthorized overdepths of excavation shall be backfilled with trench stabilization material and shall be graded to allow for the compacted bedding material.
- C. COMPACTED BEDDING MATERIAL
1. Bedding material shall be coarse aggregate size Number 57 and shall conform with VDOT Section 203 and/or ASTM C 33.
 2. The bottom of the pipe trench shall be excavated to a minimum overdepth of four (4) inches below the bottom of the pipe, to provide for the compacted bedding material. Bedding material shall be placed, shaped and compacted.
 3. Bell holes and depressions required for the jointing of the pipe shall be dug after the compacted bedding material has been graded and shaped and shall be only of the length, depth and width required to make the joint properly.

PIPE, JOINTS AND FITTINGS

- A. SCOPE OF WORK
1. All materials and appurtenances required for the work shall be new, of first class quality and shall be furnished delivered, selected, connected and finished in every detail as specified in the drawings. Materials found defective, regardless of the circumstances, shall be replaced with new material at the expense of the Contractor.
 2. The materials specified for the construction shall comply with the latest revisions of the applicable American Society for Testing Materials (ASTM), American National Standards Institute (ANSI) and/or the Virginia Department of Transportation (VDOT) standards.
- B. OPTIONAL PIPE SELECTIONS
1. The Contractor shall install only one (1) type of pipe

between structures except where ductile iron pipe is specified or indicated. Where existing pipe is to be replaced or extended the same type of pipe shall be installed, unless specified or indicated otherwise.

TYPES OF PIPE (W)

1. Polyvinyl chloride (PVC) pipe shall conform to AWWA C900 DR 18 as a minimum unless specified or indicated otherwise. All PVC pipe must bear the National Sanitation Foundation Portable Water (NSFP) stamp. Only bell and spigot with elastomeric gasket joints shall be used. To facilitate future location of PVC water pipe, a metallic wire or locator tape shall be laid with the pipe and in contact with all fittings and valves.

B. INSTALLING WATER MAINS

1. The water main shall be laid and maintained at the required lines and grads with fittings and valves at the required locations.
2. Ductile iron pipe shall conform with AWWA C 151/ANSI 21.51 and fittings shall conform with AWWA C 110/ANSI 21.10. The pipe and fittings shall be black coated and covered in accordance with AWWA C 104/ANSI 21.40. The pipe thickness shall conform with AWWA C 150/ANSI 21.50 and shall be Class 51, as a minimum, unless specified or indicated otherwise.

D. JOINTS COUPLINGS, AND APPURTENANCES

1. PVC pipe and fittings shall be bell and spigot type joints. The bell and spigot joint shall be sealed with elastomeric gaskets conforming to ASTM D 3812. The joints shall be made in strict accordance with the recommendation of the pipe manufacturer.
2. All PVC pipe fittings must meet pipe specifications for SDR-21 pipe and be of the same manufacturer as the pipe. All in accordance with AWWA specification C-110 and ANSI specification A21.10.

E. GATE VALVES

1. Gate Valves shall be Iron-body, bronze-mounted, double-disc, parallel-seat, O-ring seated, inside-screw, non-rising stem, fitting with each square operating nut for each valve. Gate valves will be built in accordance with standard C500 (latest revision). Connections shall be suitable for the pipe with which it is used. The valves shall be suitable for 200 p.s.i. water working pressure and shall be tested at twice the rated working pressure. All gate valves shall be tested (in the open position) equipped with a 2-inch square operating nut. The nut shall be marked with an arrow and the word "OPEN" and shall open turning to the right (clockwise).

F. VALVE VOUTS

1. Valve vaults shall be precast concrete with cast iron frame and covers. The cover shall be marked as shown on the details. Sizes and dimensions shall meet those shown on plans and details.
2. Trenches shall be excavated in straight lines and shall be accurately graded in order to establish a true elevation for the invert of the pipe.
3. The width of trenches, from existing grade to one (1) foot above the top of the pipe shall be of sufficient width to permit the proper installation of bracing, shoring or sheeting.
4. The sides of the trenches shall be as vertical as practical.
5. Excavation for structures shall allow a minimum of twelve (12) inches clear between the structure and the sides of the trench or any required bracing, shoring or sheeting.
6. Excavated materials suitable for backfill shall be stockpiled in an orderly manner at a sufficient distance from the sides of the trench in order to avoid oversteepening the banks of the trench and to prevent slides or cave-ins.
7. Excavated materials which are not required or approved for backfill shall be removed from the site and disposed of by the Contractor, at his expense.
8. Contractor shall adhere to all local, state and federal construction laws, including D.S.H.A. trench safety regulations.

G. PIPE INSTALLATION

1. The Contractor shall not lay pipe or place manholes until all water has been removed from the trench, or when in the opinion of the Engineer, the trench or the weather conditions are unsuitable for work.
2. Pipe that may require field cutting shall be done so in a neat and workmanlike manner, so as to leave a smooth end at right angles to the axis of the pipe. Care shall be taken to avoid damaging the pipe and any coatings or linings. Ductile iron pipe shall not be cut with an acetylene torch.
3. The materials shall be visually inspected for defects before lowering the pipe or placing the manholes into the trench. During the lowering operation, clothing or other material shall not be placed in the pipe or manhole. The interior of the pipe shall be clear of all soil, debris and superfluous materials prior to and during the installation.
4. The Contractor shall exercise every precaution to prevent foreign material from entering the pipe while it is being placed in the trench. Failure by the contractor to take such precautions may result in the Engineer requiring a heavy, tightly woven canvas bag of suitable size be placed over each end of the pipe and removed only when the joint can be made properly.
5. The pipe and manholes shall be lowered carefully into the trench by suitable means and handled with care at all times to avoid damage. Under no circumstances shall the materials be dropped or dumped into the trenches.
6. When work is not in progress, the Contractor shall plug the open ends of the pipe to prevent trench water or other liquid from entering the pipe. The plug shall be watertight and shall remain in place until any required dewatering has been completed.
7. Water pipe shall not be laid closer horizontally than ten (10) feet from a sewer line except where the bottom of the water pipe is at least 18 inches above the top of the sewer line and will be in a separate trench. Water pipe shall not be allowed to pass through a sewer manhole.
8. Before joints are made the pipe shall be well bedded on a firm foundation and no pipe shall be brought into position until the preceding length has been thoroughly embedded and secured in place. Any defects due to settlement shall be made good by the Contractor at his expense. Bell holes shall be dug sufficiently large to insure the making of proper joints.
9. Pipe shall be jointed in full accordance with

manufacturer's recommendations. Push-on joints shall be thoroughly cleaned, the rubber gasket inserted in the bell socket, thin film of approved sealant applied to the spigot end of the pipe and the pipe centered into the socket and the joint completed by forcing the spigot end to the bottom of the socket by a jack-type tool or other device approved by the Engineer. Mechanical joints shall be thoroughly cleaned, the pipe glued onto the spigot end of the pipe, the rubber gasket placed with soot solution and placed on the spigot end, the spigot end of the pipe seated in the bell, the gland moved into position, and bolts and nuts assembled by hand and tightened with an approved torque-limiting wrench.

H. BACKFILL BELOW UNPAVED AREAS

1. Backfill from the top of the pipe bedding or bottom of the pipe trench to one (1) foot above the top of the pipe shall be free of stones larger than two (2) inches in diameter and shall be placed in layers not to exceed six (6) inches and compacted with hand operated tamers.
2. Backfill from one (1) foot above the top of the pipe to the topsoil subgrade shall be free to stones larger than six (6) inches in diameter and shall be placed in layers not to exceed six (6) inches and compacted with mechanical tamers.

I. BACKFILL BELOW EXISTING OR NEW PAVED AREAS AND SIDEWALKS

1. Backfill from the top of the pipe bedding or bottom of the pipe trench to one (1) foot above the top of the pipe shall be free of stones larger than two (2) inches in diameter and shall be placed in layers not to exceed six (6) inches and compacted with hand tampers.
2. Backfill from one (1) foot above the top of the pipe to the pavement subgrade shall be free of stones larger than four (4) inches in diameter and shall be placed in layers not to exceed six (6) inches and compacted with mechanical tamers.

J. DISINFECTION OF WATER MAINS

1. All pipe shall be disinfected, tested and flushed in accordance with AWWA Standard C651 (latest revision).
2. Contractor shall provide all materials, equipment, necessary tools and perform all work required for the sterilization, testing and flushing of the water main.

K. TESTING OF WATER LINES

1. After placing all backfilling and all valve support concrete, sufficient backfill shall be placed prior to filling the pipe with water and field testing to prevent lifting of the pipe. When local conditions require that the trenches be backfilled immediately after the pipe has been laid, the testing shall be carried out after the backfilling has been completed but prior to placement of the permanent surface. Tests for one (1) hour shall elapse after the last valve support or hydrant block has been cast (Type I Portland Cement) prior to testing, unless high early strength concrete (Type III) is used, in which case three (3) days shall elapse.

L. PRESSURE TESTS

1. All testing will be performed in accordance with the AWWA C600-82 or current revision.
2. Pressure Test: After the pipe has been laid, all newly laid pipe or any valved section thereof shall be subjected to a hydrostatic pressure of at least 1.5 times the working pressure at the point of testing.

M. LEAKAGE TESTS

1. not less than 1.50 times the working pressure at the highest point along the test section;
2. not exceed pipe or thrust restraint design pressures;
3. be of at least 2-hour duration;
4. not vary by more than + 5 psi;
5. not exceed twice the rated pressure of the valves or hydrants when the pressure boundary of the test section includes closed gate valves or hydrants;
6. not exceed the rated pressure of the valve.

N. BACKFILLING

1. Following chlorination, the piping shall be thoroughly flushed. The Virginia Waterworks Regulations require at least two consecutive satisfactory bacteriological samples at 24 hour intervals from the distribution system at most 1000 feet apart. These samples may be placed in service. If the initial testing is not satisfactory the new lines will be retested until satisfactory results are achieved. Samples will be collected in accordance with the Virginia Waterworks Regulations.

O. JOB CONDITIONS

1. Prior to placing backfill, all organic, rubbish, debris or other unsuitable or objectionable material within the trench shall be removed. All concrete forms shall be removed. All shoring or sheeting shall be removed or cut off at the depth stipulated by the Engineer.

P. BACKFILL MATERIAL

1. Materials for backfill shall be approved excavated material or approved suitable material obtained from other sources. All material shall be approved by Soil Engineer.

ADDITIONAL REQUIREMENTS

A. GENERAL

1. No water main shall be laid within thirty (30) feet of a sewage drainfield.
2. If rock is encountered in the water main trench, the rock shall be removed to a level where six (6) inches of gravel bedding can be installed for the water main.
